

Once I sent a dataset file "hdp1.csv" in mail, your college mail, download it

using read_csv, load the csv file into a dataframe, then do the following operations

1. Identify some numerical columns, and plot them using plot function, do plot for various columns in same plot
2. Some categorical columns are there, convert them into freq list like from a particular categorical column, get 2 lists, one is column list and another is freq of each element of the categories in the main column. Do bar graphs and pie charts for these categorical columns
